

# Finish-Line Installation: Vinyl Fencing

## Spacing

We recommend that you space 5 strands of Finish-Line Fencing 7 to 12 inches apart. (Fig.5) The top strand should be a minimum of 48 to 54 inches from the ground and 2 to 4 inches from the top of the post. The bottom strand should be 14 to 20 inches off the ground. (We recommend that you include the use of an Electric Rope as a top line. If you do this, increase the hole diameter from 9/32" to 5/8" or use an offset bracket. This will enable the electric poly rope to run through the post.) This will keep the horses off the fence, which is desirable with any fence system. If predators are a concern, use a strand of Electric Fence line as the bottom line.

## Stallions and Jumpers

For extra fence height, use 6 to 7 strands of Finish-Line Fencing. Fencing can be used to separate stallions and mares. It can also be used to create a walkway between them. An optional 1½" x 5½" or 2" x 6" top rail or mid rail may be added for a more visible barrier.

## Installation

Finish-Line Equine Fencing can be installed by drilling through line posts and running Finish-Line wire through the holes to the end post where it will be secured. Posts can be ordered pre-drilled. A wood template (2" x 2" x 6") with 9/32" holes pre-drilled will allow for fast hole alignment. For installation on hillsides, drill holes slightly lower on the down hill side of the post.

## Line Attachment to Line Posts

When it comes to vinyl horse fence posts, the best way to install Finish-Line is to drill the required number of holes in the rail post. This allows the Finish-Line to ride smoothly through the center of the post. This improves the aesthetics of the fence and reduces maintenance. This is standard on all 5" vinyl post.
